

BUILDCHAT — SIGUE MX

Development transcript / working log

Important: This document records the development decisions available in the working project context. It is not a fabricated verbatim export of a coding-agent session. If the instructor requires the platform's full raw transcript, export the actual Cursor/coding-agent conversation and replace this file before submission.

Exchange 1 — Operator

User: Week 5. I am the ADVERSARY. Let's begin.

Decision: Use the ADVERSARY role to attack the assumption that early detection automatically creates health value.

Exchange 2 — Product direction

Decision: Reject a symptom-checker chatbot. Choose the Detection → Treatment Navigation vacuum from the Week 5 brief.

Exchange 3 — Product concept

Decision: Build **SIGUE MX — Del resultado al siguiente paso**, a navigation layer that helps a person interpret a screening result, identify a realistic next step, prepare for the appointment, and recover when access fails.

Exchange 4 — Adversarial challenge

Challenge: A technically accurate result can still cause harm if the user misunderstands screening as diagnosis or cannot act on the recommendation.

Response: Treat interpretation as a condition of value. Use the framework **Detection → Interpretation → Action**.

Exchange 5 — Safety constraints

Decision: No diagnosis, no treatment recommendations, no false certainty, no invented provider availability/prices, and no claims of verifying a person's medical status. Use simulated data for the MVP.

Exchange 6 — Global → local benchmark

Decision: Use NHS Healthier You, Unite Us, and PROSPERiA/retinIA as benchmarks. The transferable lesson is not to copy a foreign system literally, but to combine detection with a downstream pathway appropriate to local access constraints.

Exchange 7 — Persona test

Decision: Test with a 55-year-old informal worker who is too rich for free care to reach easily but too constrained for private care. Focus on where she gets lost after a positive result.

Exchange 8 — Final adversarial position

Position: Against the provocation as an absolute statement, but strongly against deploying early detection as if detection itself were the solution. Detection becomes health value only when interpretation and a realistic action path exist.

Next required build actions

Implement the flow, run the persona test, document the fixes, deploy the app, capture the final demo, and export the actual full coding/development transcript required by the assignment.
